Vizualization of FrED Run Conditions.

Various methods to vizualize FrED Run Conditions (time-invariant) in preparation for regression analysis.

Uses auto porcessed run condition data - "Run Condition Data Summary.csv"

J. Cuiffi, - Penn State New Kensington

```
In [1]: import pandas as pd
    import numpy as np
    import matplotlib.pyplot as plt
    import seaborn as sn
    from mpl_toolkits.mplot3d import Axes3D
In [2]: # load run condition data into dataframe
    # current file - 050820 11:06pm
    path_local = 'C:/Users/cuiff/Dropbox/Python Common Library/python-fred/data/Reports/'
    data = pd.read_csv(path_local + 'Run Condition Data Summary.csv')
    data
```

Filament Std Dev (%) versus Feed Speed and Heater Temp (.215mm nominal)

Power Consumption

Explore power consumption to optimize cost

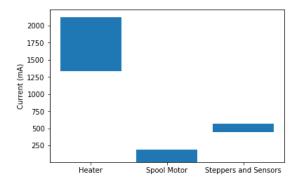

In [38]: # explore with correlation matrix
create reduced feature dataframe
df = data[['System Power Ave (W)','Spool Rate Ave (RPS)','Heater Temp Ave (C)','Feed Rate Ave (RPS)']]
#sn.heatmap(df.corr(), annot=True)
#plt.show()
%matplotlib inline
sn.pairplot(df)
plt.show()
df.corr()

Out[38]:

	System Power Ave (W)	Spool Rate Ave (RPS)	Heater Temp Ave (C)	Feed Rate Ave (RPS)
System Power Ave (W)	1.000000	0.137786	0.879243	-0.115448
Spool Rate Ave (RPS)	0.137786	1.000000	-0.114830	0.325072
Heater Temp Ave (C)	0.879243	-0.114830	1.000000	-0.338853
Feed Rate Ave (RPS)	-0.115448	0.325072	-0.338853	1.000000

Ranges of Current Contribution

```
In [43]: # plot heater current versus temperature
fig, ax1 = plt.subplots()
fig.set_size_inches(10,5)
ax1.scatter(data['Heater Temp Ave (C)'],data['Heater Current Ave (mA)'])
ax1.set_xlabel('Heater Temperature (C)')
ax1.set_ylabel('Current (mA)')
print('Heater Current versus Temperature')
```

Heater Current versus Temperature

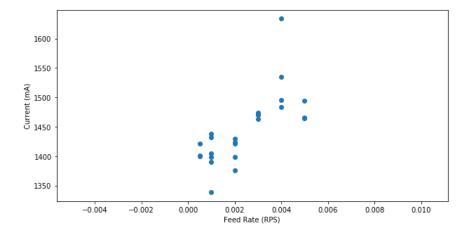

```
In [44]: # plot heater current versus feed rate at a given temperature
# pull out data that is nominally 80C

df = data[data['Heater Temp Ave (C)'] < 80.5]

df = df[df['Heater Temp Ave (C)'] > 79.5]

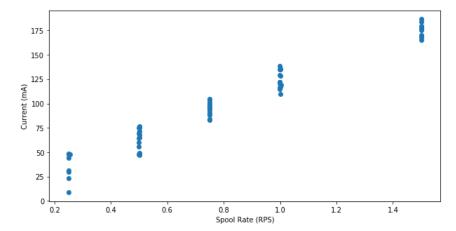

fig, ax1 = plt.subplots()
fig.set_size_inches(10,5)
ax1.scatter(df['Feed Rate Ave (RPS)'],df['Heater Current Ave (mA)'])
ax1.set_xlabel('Feed Rate (RPS)')
ax1.set_ylabel('Current (mA)')
print('Heater Current versus Feed Rate at 80C')
```

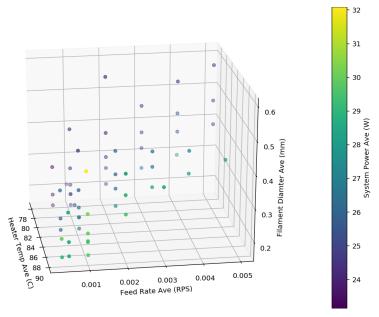

Heater Current versus Feed Rate at 80C

```
In [46]: # plot spool current versus speed
fig, ax1 = plt.subplots()
fig.set_size_inches(10,5)
ax1.scatter(data['Spool Rate Ave (RPS)'],data['Spool DC Motor Current Ave (mA)'])
ax1.set_xlabel('Spool Rate (RPS)')
ax1.set_ylabel('Current (mA)')
print('Spool Motor Current versus Spool Speed')
```

Spool Motor Current versus Spool Speed

Fiber Diameter versus Feed Speed and Heater Temp (colored with Power)

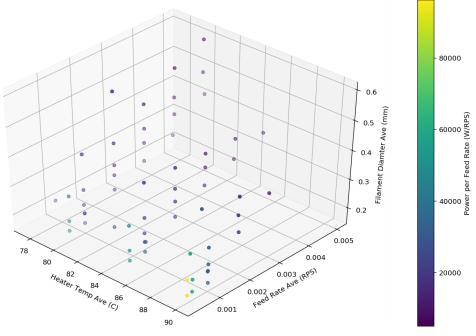

In [48]: # add a dataframe column that includes power per feed rate
 data['Power per Feed Rate (W/RPS)'] = data['System Power Ave (W)'] / data['Feed Rate Ave (RPS)']
 data
